

THANK YOU FOR CHOOSING THE **DUNG MASTER** ALL-IN-ONE GROW BAG!

This bag is designed for high-performance results using a dung-enriched substrate. *Please read this guide fully before getting started.*

STEP 1 INJECTING THE BAG

1. Wash hands or wear gloves
2. Remove from packaging (no scissors!)
3. Shake syringe (5 sec), attach needle
4. Do NOT heat the needle – it's pre-sterile
5. Clean the rubber injection port with the alcohol wipe
6. Inject through port:
 - 1LB/2LB: up to 10ml • 4LB: up to 20ml
7. Open the bag gently above the substrate up to the filter patch — this creates an air pocket
8. Do not mix the bag at this stage
9. Place flat in a dark space (24–27°C) on a heat mat or inside a heat box

STEP 2 COLONISATION

1. Keep sealed in darkness at 24–27°C
2. After ~2 weeks, look for white mycelium
3. At ~30% white: mix the bag gently
4. Wait 10 more days – mix again at ~50–60%
5. Once 95–100% white, it's ready to fruit

STEP 3 FRUITING

1. Keep temp 24–27°C, with 12h light / 12h dark
2. Keep the bag fully sealed. There is no need to cut it open or mist it at any point. The bag is designed to naturally maintain the ideal humidity and airflow for fruiting.
3. Pins (baby mushrooms) typically appear in 7–21 days

STEP 4 HARVEST

1. Harvest when the veil under the cap starts to tear
2. Gently twist or cut mushrooms at the base
3. Keep the bag — more flushes are coming!

STEP 5 ADDITIONAL FLUSHES

1. Rehydrate after first harvest:
 - Pour water 1/2 a cup of water around edges of the block
 - Soak 12 hrs, then drain completely
 - Let sit open or tilted for 30–40 mins
2. Return to fruiting setup
3. Expect 2–3 flushes per bag
